

## **The Targeting Transformation of Anxin-China ISD System from Pilot Corporations to Individual Households**

At 4:00 a.m., May 6<sup>th</sup>, 2013, an fire hazard occurred in Humen, Dongguan City, Guangdong Province. As a result, eight dead, three injured. The neighbors participating in this rescue told journalists that there was a big fire expanding from the first floor towards the 2<sup>nd</sup> and 3<sup>rd</sup> floors. Many local households hoped some government departments to take effective measures to monitor those blocks, so as to avoid unnecessary accidents.

In terms of this case, we should consider that which way is appropriate for us to make use of to strengthen the security surveillance of the common public. Anyway, at present, most security systems stay in independent operation, far away from the real-time monitoring and real-time alerting. Whereas, the Anxin-China ISD system could combine all access controls and other security equipments into a whole centralized administration in a whole building, which could bring a great security guarantee.

Now, with full safety consciousness, lots of companies have installed and deployed a variety of access control, anti-fire and anti-theft alerting system, all of which are rather independent and inefficient. They cannot effectively prevent the dangerous fire hazard or theft cases, without the access to putting those security surveillance devices and systems into an organic administration model. In a word, it's required to make use of some means to a real-time leaked auto-alerting system.

It will promise the safety to a higher degree if all independent security systems are connected to the united surveillance administration center. Anxin-China always desires to bring the safety to every household. For example, this fire hazard in Dongguan brought out more broken families more than economic losses. Only if the system linkage was realized, the chances of accidents would decrease largely. Considering those opinions, Anxin-China states that, it has a practical significance to introduce the security surveillance model into people's daily life, which could largely embody and promote the development of "Smart City, Safe City" Plan.

However, the safe production makes a big influence on the lives of civilians, while the lives are more important than economic losses led by occasional accidents. Therefore, Anxin-China
