

## **Anxin-China Provides the Best Solution to Solve PM2.5**

The autumn has come, but the sky becomes grey in north China due to the heavy mist weather, reported [www.cnr.com](http://www.cnr.com). According to the data from Beijing Environment Monitoring Centre, the PM2.5 concentration in Beijing reached the severe contamination level on October 6<sup>th</sup>.

In fact, Beijing is not the sole city suffering from the mist weather, as Henan, Hebei and et al. are involved in such a hard issue. Presently, several high roads have been closed to prevent the occurrence of traffic accidents in the province.

In addition, the National Meteorological Centre released the haze yellow warning signal at 6:00 p.m. yesterday, predicting that a medium-degree haze would appear in Beijing, Tianjin, Hubei, Shanxi, Henan and et al, and it was even worse in some areas. Thus, the visibility largely decreased inside Hebei, which also led more road traffic cases.

Anyway, it seems that we have been accustomed to this kind of news appeared in a variety of news media or presses. Such a serious environmental phenomenon has indicated that we lack the attention to effectively monitor the atmosphere around us, or in other words, we haven't thought about how to manage and regulate our behaviors while the modern technologies develop so fast. Herein, Anxin-China has been developing the world's leading ISD system to solve such a environmental problem.

Anxin-China's environmental ISD system makes full use of the PM2.5 index sensor to monitor the PM2.5 index in real-time. It means a long-term surveillance towards the index change in real-time, and form a series of data to help monitoring personnel to find out the cause of atmospheric contamination instead of a traditional surveillance method. It is in a basic way that Anxin-China can work out the most effective tool to solve the atmospheric issues.
