

## **Anxin-China ISD Largely Promotes the Public Safety Production**

(Shaanxi-May 10<sup>th</sup>) Recently, some common residents in Shaanxi Fugu County disclosed the news to *China Construction News* that a private enterprise arbitrarily starts the coal mining production during the particular period of integrating coal mining production and technical transformation, which ultimately led an occasional top carving accident on June 15<sup>th</sup>, 2012. And it was concealed that 8 miners was dead therein.

In fact, this is another time for the blinded enterprises to earn ill-gotten money with creating such terrible cases, which is also due to the weak regulation of related government departments. Herein, we are required to consider that what exactly the best mean is to improve the promotion of both government's regulation power and corporate security consciousness. Accordingly, Anxin-China releases the well-know ISD system, a most advanced intelligent video surveillance system, to realize the great project of constructing smart and safe city, while cooperating with related departments to promise the whole economic development from the perspective of safe production. It penetrates former, middle, later stages of safety production from multiple aspects including surveillance, command, management and rescue, so that a set of scientific monitoring measures can be achieved.

Anyhow, safety is first, which is also the mission of Anxin-China ISD system in the practical application. Truly, the governmental security departments need this tool to execute the regulations and laws more effectively because it presents higher efficiency than common surveillance personnel.
