

State Council Execute Meeting Emphasized Precautions to Be Further Realized in Safety Production

Li Keqiang, premier of State Council hosted the State council execute meeting on June 5th, pointing out that local government departments at all levels should take more efforts to make precautions in the safety production area while preventing the occurrence of major work safety accidents.

The fire hazard happening on June 3rd in Baoyuan Company, Jilin has consequently led 120 deaths, which warns the whole country about the dangerous fire hazard and indicates the severe safety production status.

It's specially emphasized in the meeting that, the safety productions always acts at the basic premise of constant healthy economy development and improved economy transformation; thus, all local government departments at all levels should firmly insist on the "people oriented, safe development" principle to put the safety production into a perfect order.

Yang Dongliang, the chief director of State Administration of Work Safety, has ever said that the unacknowledged subject responsibility of corporate safety production is the major element leading a large number of safety accidents: shortage of investments in some small coal mine exploiting sites, lagging technical equipments, low safety support capability; and some enterprises even have major potential risks without effective solutions; some other corporations have weak management.

The meeting also focused on that, the responsibility construction of safety production should be strengthen while all noncommittal personnel are supposed to receive the expected punishment without any merciful items; the government authority and execution force should be promised through the effective accountability mechanism.

"The reasons of accidents need to be studied more than responsibility track. We should realize the natural principle of summarizing the phenomenon into law, changing law into system, and

transforming system into action.” said Liu Tieming.

Accordingly, Anxin-China put more attentions and efforts into acknowledging all details about this big fire hazard in Jilin, and then presented an industrial analysis report on June 4th. This report showed that the application of ISD or iVAS system could effectively prevent this kind of fire disaster due to the advancement and compatibility of Anxin-China ISS system. As you know, Anxin-China has been developing the video surveillance technology for many years, making a great contribution to China’s safety production industry. Anxin-China always lays stress on the fabulous combination of both precaution and mid-handling, to help all safety surveillance departments and corporations to prevent the hazard’s occurrence. Now, State council and Anxin-China arrives at the same theory occasionally that effective measures should be taken to prevent the accidents from the original source to keep residents’ lives and financial properties.

China is a developing country on the way to achieve a series of grand goals. all industries and corporations should stay the positive developing stage with absolute safety production environment. Thus, Anxin-China strongly appeals for the significant safety production platform construction to keep economic development away from industrial accidents, people’s deaths and injuries.
