

## ISD System Prevents the Water Pollution

Some days ago, an accident just happened in the neighborhood of a factory in Xi'an city that Mr. Yang fell off his electric bicycle and got a bad hurt, which was due to factory's polluted water covering the bumpy cement pavement. In the past two years, Shaanxi Jiale Paper-plastic Products Co., Ltd had always allowed its polluted water to flow towards the road surface outside. As a result, a stretch of cement road with about one kilo-meter long was destroyed seriously while disturbed the normal trips of nearby residents.

Of course, it's not fresh to hear the news that factories discharge of sewage effluent at their own will, which often disgust people's eyes on the newspaper. Then, what's the best way to solve this difficult issue? In fact, here is Anxin-China ISD system is preferable to help government surveillance departments to deal with this problem. Anxin-China ISD can effectively monitor sewage draining exits and exhaust ports to acknowledge the key index concentrations of outgoing polluted water and air in real time; it also monitor the factory's specific operation conditions through the video surveillance, so as to realize the all-round supervision.

However, the complete industrial trend is a two-edge sword that it brings humans with both large economy benefits and environmental problems. Accordingly, the comprehensive treatment is the key point of development. Anxin-China always takes the responsibility of protecting our living environment, intending to make contributions to China's green environment protection industry through constant efforts and endeavors.
