

## **Anxin-China iVAS Effectively Protects the Cultural Relics**

Recently, the topic has caused hot discussions among China's public that Egypt Luxor Temple reliefs are largely damaged by Chinese tourists' erosion. Now it's confirmed that those scripts on the reliefs have been actually wiped.

The Egypt authority stated that the writing marks on the reliefs hadn't broken the wall body, and all tourists' marks had been wiped after the wall restoration then. Furthermore, the director of Luxor Cultural Relics Department emphasized that the tour guides were supposed to give more obvious travelling tips to those tourists to prevent the occurrence of those negative matters.

Anyway, some archaeologists even suggested that the glass covers should be put on the outskirts of the cultural relics and that the inspection patrol be strengthened. Despite of the critics concerning "no quality" Chinese tourists, we may think in another way that Singapore creates a fabulous urban living environment due to the serious legal punishment. Thus, the best means to prevent those unexpected cases is to strengthen the management and protection of cultural relics.

Accordingly, Anxin-China iVAS is specially developed for the protection of cultural relics and valuables, which can be applied into the security industry with a great efficiency. Within preset rules, iVAS can send real-time alerts to remind some surveillance personnel to take measures as the one particular tourist touches or removes the cultural relics. Herein, the glass cover can be also put into those cases to enhance the inspection effect. Thus, Anxin-China iVAS system can largely promote the security of museum, while protecting the major exhibitions in a much effective way.

However, the protection of cultural relics depends on the iVAS system more than the simple moral restraints, because it provides an outstanding means to protect the target things from damages and harms.
