

The Popularization of iVAS System Could Make Your Life Safer and Better

According to the latest report from Nandu News, in recent years, a series of theft cases often happened in the Xinxin Homeland District. On the morning of May 3rd, 2013, a collective theft case occurred while twenty residents' properties are stolen, including well-known cellphones, laptops as well as some other cashes. The monitoring video in the district indicates that two criminal suspects took only 99 seconds to finish the whole theft action, from climbing the outer wall, to leave the house. Herein, the local police office officially stated that they would appeal more human resources to work out this case.

Anyway, with the life quality developing so fast, the high technology also becomes a double-edged sword, so that many criminals take all available means to execute all kinds of criminal acts. Both personal property and life are very important. So, how to keep the homeland's security under control? Herein, Anxin-China iVAS system could give a big hand.

Through installing such an effective security surveillance system, the traditional artificial surveillance changes into intelligent computing system surveillance in the residential districts. It will realize the real-time security monitoring and detection towards the particular target surveillance area. Thus, any suspicious individual, detained in the target place or climbing from the outer wall into the balcony, will make the system send real-time alerting to monitoring personnel, so that these thieves could be caught.

Moreover, Anxin-China can also develop the most appropriate and practical system to match different requirements, while promoting the efficiency of security surveillance and real-time alerting to a position as high as possible. Therefore, the popularization of Anxin-China iVAS system is the mainstream in the present security market, which could actually bring the common residents with a safe homeland as well as better life quality.
