

The Public Security Needs Anxin-China iVAS to Prevent Elevator Accidents

Recently, the elevator accidents have frequently occurred in Yichang, Xi'an, Shenzhen, Yuxi and etc, with 4 deaths. According to the incomplete statistics, there were totally 36 elevator incidents only in last year, with leading 28 deaths. Thus, such a particular kind of social disaster requires our attention to come up with solutions to prevent deaths in the same accident.

Of course, it's very universal that elevator accidents could happen every year. And in the present society, only the accidents occurred could stimulate some security departments to take some measures to do the security check, which just brings out some dispensable slogans instead of good efficiency. In essence, those thoughts are too useless to take precaution against those terrible matters. Then, we really need to consider the issue that how our reflection cannot change the elevator accidents in existing public security area. Actually, here is an effective solution provided by Anxin-China which has been developing the video surveillance security system to improve the China's present security environment. Specifically, as an important enterprise supported by the government department, Anxin-China unveils the iVAS to monitor traffic sites and orbits. iVAS could be also applied into the normal elevator operation. Surveillance personnel can preset particular rules to limit the people density and number inside the elevator, so that some accidents triggering the preset rules can immediately make a response to reduce the elevator risk.

For the government security departments, it is required to take the related responsibility to recognize their own positions and realize their supervision rights. In fact, Anxin-China iVAS system is supposed to be the best solution to help them to solve the public security surveillance issue, promising the life safety of urban citizens.
