

Anxin-China Presents Its Edges in Preventing Toxic Gas Leakage

(Qingdao,Shandong-Sep.17th) On the morning of Sep. 16th, 2013, a resident suddenly smelt a strange odor in Taixue Road, Huangdao District, Qingdao City, and then felt it was very difficult to breathe. Actually, it was confirmed soon that this cases wad led by an ammonia gas leakage from an ice making plant. Consequently, under the help of policemen and fire personnel, four residents with deep poisoning were sent to the local hospital for emergency cure. The result of further investigation was that the ammonia gas leakage occurred while the personnel putting the ammonia gas with too large pressure made the pipe tube broken. At present, this ice making plant is punished to stop production, and related persons in charge are under control.

We all know that the increased GDP value with insecure industrial production needs to be condemned seriously. And at the same time, we government spare no effort to take effective measures to ensure the safety production while supervising and urging enterprises to execute the safety precautions to protect the lives of factory workers and urban residents. Whereas, tragedies are still led by some crafty corporate principals who try their best to seek the system defects and loopholes to reduce the policy costs on security precautions. Accordingly, in order to solve such a long-term traditional issue, Anxin-China has spent several years developing the advanced security surveillance and precaution systems, ISD and iVAS systems. In fact, both systems aim to help governmental departments and local enterprises to overcome the problems in the corporate surveillance which is difficult to realize in the actual conditions. In other words, the problem rooted in the industrial production process can be totally wiped out by both safety and construction of ISD and iVAS. Anyway, ISD can give full play to its perfect surveillance and precaution mechanism, or to be more specific, it can detect the toxic gas at the first time and then send alerts to the command center for emergency rescue plan. Thus, such a reliable system is supposed to reduce the life damages and economical losses to the minimum extent.
