

Take Care: Violated Pollution Emissions Damage the Environment

On July, 2th, Source from people.com.cn, black, red and green industrial wastewater, coming from six chemical industrial corporations in Shaoyang, Hunan, directly flowed into Zijinag Rvier without any industrial processing. Actually, dating back to the year 2011, Shaoyang environmental protection agency had made a special project report about this issue to the local government, consequently, those corporations still let off the wastewater which seems to be normal and legal.

On the afternoon of June, 20th, the journalist came to visit one chemical factory in Shaoyang , finding that vivid red wastewater flowed in the sewer. Accordingly, the common public reflected that it was those wastewater without any industrial processing that directly flowed from that chemical factory into the urban tube network.

Herein, some laid-off workers of this chemical factory just lived in a tube-shaped apartment next to this factory. Lu Runsan, a 43-year-old worker of this factory, said with pointing at the factory's chimney that this factory realizes three eight-hour shifts while the whole livelihood district will be covered under the black polluted air as the wind blows from north; the corporation don't install the environmental protection facility though the local resident have a deep communication with the chemical factory.

As to this case, Ning Shaohua stated that Shaoyang environmental protection agency has investigated this case with finding no heavy mental elements were over standard, anyways, those corporations should close to take corrective measures because wastewater could harm the local river water.

Then, the journalist tried many efforts to attain the fact that nine corporations in this area didn't install the online surveillance device, herein, 3 of them have no environmental certification, 6 of them have no approved process of environmental certification, and all of them didn't reach the standard environmental level.

However, now we can see that the key reason for the environmental pollution is the chemical factory's sly strategy more than the government's inefficient actions. Anyway, those chemical factories didn't install the online-surveillance devices, which directly led the occurrence of constant wastewater and gas omission. Accordingly, Anxin-China has previously decided to develop the particular ISD system in environmental area while seeing this serious, awkward situation. Specifically, the environmental ISD system is a newly-invented system on the basis of the original working model, whose special feature is that its surveillance sensor only monitor all kinds of index density values; it will immediately make alerting as the index value exceeds the critical value. Moreover, we apply another iVAS system into the environmental ISD system, to realize the strategy that it will immediately make alerting as wastewater occurs in the surveillance points.

Above all, all of us should clearly remember the truth that our lives and social development stay on the basis of environment, thus, Anxin-China's ISD system is supposed to help us to protect our indispensable living environment-the earth!
